LHCb Controls

Status and Progress 15 June 1998 P. Mato, CERN

Progress

- ◆ User Requirements
 - Joint LHCb/ALICE URD for the DCS kernel
 - » Available as LHCb note 98-005
 - No much progress on the LHCb specific
 - » Questionnaire sent. One reply received.
 - » Maybe is too early?
- ◆ LHC Joint Control Project (JCOP)
 - We are putting quite a lot of effort from LHCb (0.5 FTE)
 - Active participation in various sub-projects

JCOP

- Organization:
 - Started last December
 - Project leader: David Myers (IT/CO)
 - Steering group (2 people each experiment + 2 people CO group)
 - Project team. Meetings every 1-2 weeks.
- ◆ Current work items
 - Technology survey, CAN bus, Architecture, Safety, ...
- Workshop (CERN, June 3-5)
 - Current practices, LHC sub-detector requirements
- Information: http://itcowww.cern.ch/JCOP

JCOP: Architecture sub-project

◆ Objective

- To design and architecture which implements the known requirements (scale, DAQ integration, etc.).

◆ Deliverable

- Architectural design document by summer.

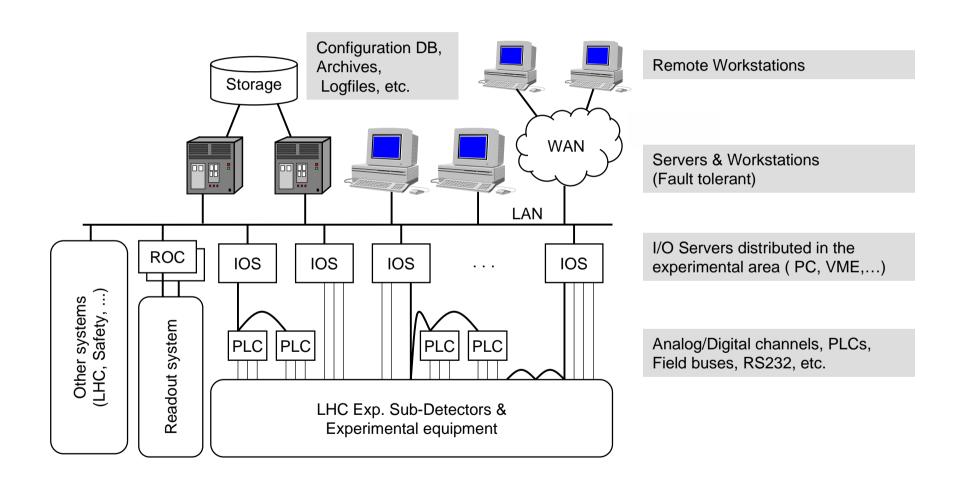

Progress

- First ideas of an architecture exists. On the process of discussion specific points.

◆ People

- About 10-12 participants (Beat, Pere, Wolfgang from LHCb)

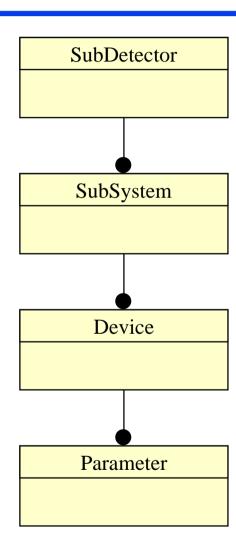

JCOP: Architecture: Hardware

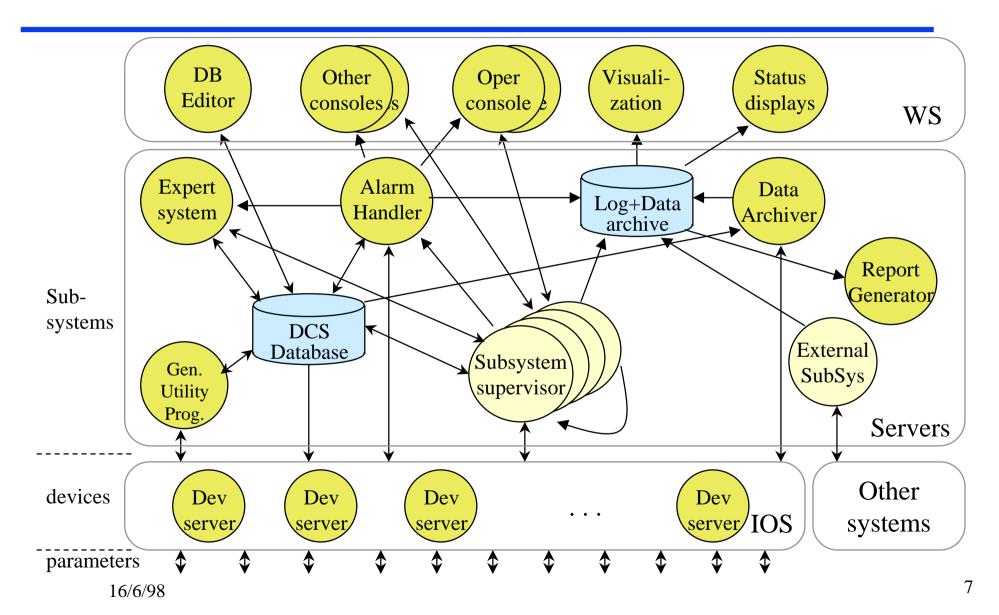

16/6/98

JCOP: Architecture: Data Model

- Hierarchy of abstractions to handle the complexity:
 - Few parameters are grouped logical into a device which represents a physical device (e.g. VME power supplier)
 - Devices are grouped into subsystems (e.g. RICH HV subsystem)
 - Each sub-detector has several sub-systems.

JCOP: Architecture: Task

JCOP: Architecture: Software

subsystems	GUI Client Applications (Consoles, DataViewer, etc.)		Config. &	
	DCS Services (Alarm Hand., Archiver, etc.)	Sub-System supervisors	Utility tools	
distributed devices	Device			
	Object Network		DCS DB	
	Distributed I/O Servers		DBMS	
devices	DeviceLib (device drivers)		Storage	
parameters	InputOutput (interface drivers)		Gen	eric
	Hardware: I/O cards, FieldBus I/F, RS232,		Spec	cific

JCOP: CAN bus sub-project

- ◆ Objectives
 - 3 parts: Hands on CAN bus, Local Monitor Box (ATLAS), Standalone small control system.
- Progress
 - Two meetings.
- ◆ People
 - Mainly ATLAS. (Andre from LHCb)

JCOP: New sub-project proposals

- ◆ A proposal from ALICE has been presented.
- Plans to propose a new sub-project from LHCb.
 - Objectives:
 - » Evaluation of the Component Technology (DCOM) for controls. (Implementation of the architecture)
 - » Evaluation of OPC (OLE for Process Control) standard.
 - People:
 - » Some fraction of FTE from existing people plus Cooperant starting in September.

JCOP Workshop

- ◆ CERN, June 3-5
- Program
 - Current Practice. Presentations from current and about to come on-line experiments.
 - LHC experiments requirements and technical sessions.
 - » Presentations from the 4 experiments.
 - Selected discussion topics: Architectures, Integration DCS and Run Control, commercial vs. home-made, re-engineering, ...
- Participation
 - About 140 people. 50% from outside CERN.

JCOP Workshop: Outcomes

- Spread of some ideas:
 - Integration with the control of DAQ. Integrated Experiment Control System.
 - The importance of well defined interfaces (architecture). Advantages of using devices instead of channels.
 - Usage of PLCs, Field buses in modern systems.
- Market survey:
 - The role of Windows NT on modern commercial products.
 - Parameter oriented instead of device oriented.
 - No FSM.

LHCb Controls project: Organization

- ◆ The LHCb Controls Project is part of the overall Computing Project which includes the on-line and off-line computing activities and covers both hardware and software.
- ◆ A dedicated team will be responsible for the common control infrastructure. The sub-detector teams will be in charge of adapting/developing sub-detector specific applications.
- Currently 3 people on the central team.

LHCb Controls project: Planning

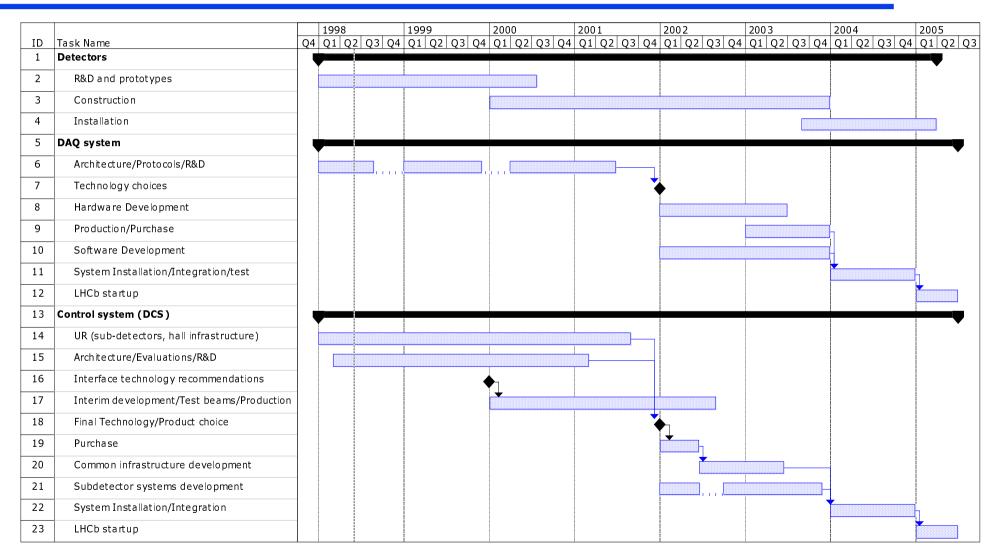

Main Milestones:

- Choice of technology for the hardware interfaces: Jan 2000
- Choice of final product/technology: Jan 2002
- Installation/integration & commissioning during 2004
- Operational system in 2005
- ◆ From now to Jan 2002 ...
 - Understanding requirements.
 - Architecture design.
 - Coordination.
 - Evaluations of products and technologies.
 - R&D. Prototypes. Interim solutions.

Evaluations, Prototypes and R&D

- Gathering knowledge for final product/technology choice.
- Activities which are interesting from our point of view:
 - Field buses: Understanding them. Hands-on practice. Limitations. Software protocols. Hardware interfaces.
 - PLCs: Understanding them. Hand-on practice. Limitations.
 - OPC standard: Understanding the standard. Test various configurations. Survey market.
 - Integration technologies: Understanding them. Building systems out of software components (componentware). Prototypes.
- ◆ Most of the activities can be done under JCOP.

LHCb Controls Project: Planning (2)

Conclusions

- We still need to do our home work of collecting and understanding the LHCb sub-detector specific requirements. Understanding time scales.
- Continuation with the participation in various subprojects in the context of the JCOP. Everybody is welcome.
